Due to their pharmacological profile the compounds of the invention may be useful for the treatment of diseases or disorders as diverse as those related to the cholinergic system of the central nervous system (CNS), the peripheral nervous system (PNS), diseases or disorders related to smooth muscle contraction, endocrine diseases or disorders, diseases or disorders related to neuro-degeneration, diseases or disorders related to inflammation, pain, and withdrawal symptoms caused by the termination of abuse of chemical substances.

## ARYL AND HETEROARYL DIAZABICYCLOALKANES, THEIR PREPARATION AND USE

### TECHNICAL FIELD

5

The present invention relates to novel aryl and heteroaryl diazabicycloalkane derivatives, which are found to be cholinergic ligands at the nicotinic acetylcholine receptors and modulators of the monoamine receptors and transporters.

10

Due to their pharmacological profile the compounds of the invention may be useful for the treatment of diseases or disorders as diverse as those related to the cholinergic system of the central nervous system (CNS), the peripheral nervous system (PNS), diseases or disorders related to smooth muscle contraction, endocrine diseases or disorders, diseases or disorders related to neuro-degeneration, diseases or disorders related to inflammation, pain, and withdrawal symptoms caused by the termination of abuse of chemical substances.

15

### BACKGROUND ART

20

The endogenous cholinergic neurotransmitter, acetylcholine, exert its biological effect via two types of cholinergic receptors, the muscarinic Acetyl Choline Receptors (mAChR) and the nicotinic Acetyl Choline Receptors (nAChR).

As it is well established that muscarinic acetylcholine receptors dominate quantitatively over nicotinic acetylcholine receptors in the brain area important to memory and cognition, and much research aimed at the development of agents for the treatment of memory related disorders have focused on the synthesis of muscarinic acetylcholine receptor modulators.

25

Recently, however, an interest in the development of nAChR modulators has emerged. Several diseases are associated with degeneration of the cholinergic system i.e. senile dementia of the Alzheimer type, vascular dementia and cognitive impairment due to the organic brain damage disease related directly to alcoholism. Indeed several CNS disorders can be attributed to a cholinergic deficiency, a dopaminergic deficiency, an adrenergic deficiency or a serotonergic deficiency.

### SUMMARY OF THE INVENTION

The present invention is devoted to the provision novel modulators of the nicotinic and/or of the monoamine receptors, which modulators are useful for the treatment of diseases or disorders related to the cholinergic receptors, and in

particular the nicotinic acetylcholine receptor (nAChR), the monoamine receptors 5-HT<sub>1</sub>, DAR and NER, and the biogenic amine transporters for 5-HT, DA and NE.

Due to their pharmacological profile the compounds of the invention may be useful for the treatment of diseases or disorders as diverse as those related to the cholinergic system of the central nervous system (CNS), the peripheral nervous system (PNS), diseases or disorders related to smooth muscle contraction, endocrine diseases or disorders, diseases or disorders related to neuro-degeneration, diseases or disorders related to inflammation, pain, and withdrawal symptoms caused by the termination of abuse of chemical substances.

The compounds of the invention may also be useful as diagnostic tools or monitoring agents in various diagnostic methods, and in particular for *in vivo* receptor imaging (neuroimaging), and they may be used in labelled or unlabelled form.

#### 10 Steric Isomers

The chemical compounds of the present invention may exist in (+) and (-) forms as well as in racemic forms. The racemates of these isomers and the individual isomers themselves are within the scope of the present invention.

Racemic forms can be resolved into the optical antipodes by known  
15 methods and techniques. One way of separating the diastereomeric salts is by use of an optically active acid, and liberating the optically active amine compound by treatment with a base. Another method for resolving racemates into the optical antipodes is based upon chromatography on an optical active matrix. Racemic compounds of the present invention can thus be resolved into their optical antipodes,  
20 e.g., by fractional crystallisation of d- or l- (tartrates, mandelates, or camphorsulphonate) salts for example.

The chemical compounds of the present invention may also be resolved by the formation of diastereomeric amides by reaction of the chemical compounds of the present invention with an optically active activated carboxylic acid such as that derived  
25 from (+) or (-) phenylalanine, (+) or (-) phenylglycine, (+) or (-) camphanic acid or by the formation of diastereomeric carbamates by reaction of the chemical compound of the present invention with an optically active chloroformate or the like.

Additional methods for the resolving the optical isomers are known in the art. Such methods include those described by *Jaques J, Collet A, & Wilen S* in  
30 "Enantiomers, Racemates, and Resolutions", John Wiley and Sons, New York (1981).

Optical active compounds can also be prepared from optical active starting materials.

#### **Methods of Producing Diazabicycloalkane Derivatives**

35 The diazabicycloalkane derivatives of the invention may be prepared by conventional methods for chemical synthesis, e.g. those described in the working examples. The starting materials for the processes described in the present application are known or may readily be prepared by conventional methods from commercially available chemicals.

Also one compound of the invention can be converted to another compound of the invention using conventional methods.

The end products of the reactions described herein may be isolated by conventional techniques, e.g. by extraction, crystallisation, distillation,  
5 chromatography, etc.

10 weight.

### Pharmaceutical Compositions

In a preferred embodiment, the invention provides pharmaceutical compositions comprising the diazabicycloalkane derivative of the invention, or a pharmaceutically acceptable salt or derivative thereof, together with one or more pharmaceutically acceptable carriers therefore, and, optionally, other therapeutic  
25 and/or prophylactic ingredients, known and used in the art. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not harmful to the recipient thereof.

The pharmaceutical composition of the invention may be administered by any convenient route, which suits the desired therapy. Preferred routes of  
30 administration include oral administration, in particular in tablet, in capsule, in dragé, in powder, or in liquid form, and parenteral administration, in particular cutaneous, subcutaneous, intramuscular, or intravenous injection. The pharmaceutical composition may be prepared by the skilled person using standard and conventional techniques appropriate to the desired formulation. When desired, compositions

The actual dosage depend on the nature and severity of the disease being treated, and is within the discretion of the physician, and may be varied by titration of the dosage to the particular circumstances of this invention to produce the desired therapeutic effect. However, it is presently contemplated that pharmaceutical compositions containing of from about 0.1 to about 500 mg of active ingredient per individual dose, preferably of from about 1 to about 100 mg, most preferred of from about 1 to about 10 mg, are suitable for therapeutic treatments.

A satisfactory result can, in certain instances, be obtained at a dosage as low as 0.1  $\mu\text{g/kg}$  i.v. and 1  $\mu\text{g/kg}$  p.o. The upper limit of the dosage range is presently considered to be about 10 mg/kg i.v. and 100 mg/kg p.o. ## Example 2

### 10 Biological Activity

#### *In vitro* inhibition of <sup>3</sup>H-5-hydroxytryptamine (<sup>3</sup>H-5-HT, serotonin) uptake in cortical synaptosomes

Serotonin transporters/uptake sites on nerve terminals presumably function to terminate neuronal signaling by removing serotonin from the synaptic cleft. The activity of the serotonin transporter integral protein can be measured *in vitro* by synaptosomal uptake of <sup>3</sup>H-5-hydroxytryptamine.

Preparations are performed at 0-4°C unless otherwise indicated. Cerebral cortices from male Wistar rats (150-200 g) are homogenized for 5-10 sec in 100 volumes of ice-cold 0.32M sucrose containing 1 mM pargyline using a motor driven teflon pestle in a glass homogenizing vessel. Monoamine oxidase activity will be inhibited in the presence of pargyline. The homogenate is centrifuged at 1000 x g for 10 min. The resulting supernatant is then centrifuged at 27,000 x g for 50 min and the supernatant is discarded. The pellet (P<sub>2</sub>) is resuspended in oxygenated (equilibrated with an atmosphere of 96% O<sub>2</sub>: 4% CO<sub>2</sub> for at least 30 min) Krebs-Ringer incubation buffer (1000 ml per g of original tissue) at pH 7.2 containing 122 mM NaCl, 0.16 mM EDTA, 4.8 mM KCl, 12.7 mM Na<sub>2</sub>HPO<sub>4</sub>, 3.0 mM NaH<sub>2</sub>PO<sub>4</sub>, 1.2 mM MgSO<sub>4</sub>, 1 mM CaCl<sub>2</sub>, 10 mM glucose and 1 mM ascorbic acid.

Aliquots of 4.0 ml tissue suspension are added to 100 µl of test solution and 100 µl of <sup>3</sup>H-5-HT (1 nM, final concentration), mixed and incubated for 30 min at 37°C. Non-specific uptake is determined using citalopram (1 µM, final concentration). After incubation the samples are poured directly onto Whatman GF/C glass fibre filters under suction. The filters are then washed three times with 5 ml of ice-cold 0.9% (w/v) NaCl solution. The amount of radioactivity on the filters is determined by conventional liquid scintillation counting. Specific uptake is calculated as the difference between total uptake and non-specific uptake.

25-75% inhibition of specific binding must be obtained, before calculation of an IC<sub>50</sub>.

The test value is given as IC<sub>50</sub> (the concentration (µM) of the test substance which inhibits the specific binding of <sup>3</sup>H-5-HT by 50%).

5

$$IC_{50} = (\text{applied test substance concentration, } \mu\text{M}) \times \frac{1}{\left(\frac{C_0}{C_x} - 1\right)}$$

where  $C_0$  is specific binding in control assays and  $C_x$  is the specific binding in the test assay (the calculations assume normal mass-action kinetics).

10

The results are presented in Table 1 below.

15 **Example 3****Biological Activity**

The affinity of compounds of the invention for nicotinic ACh receptors have been investigated in three test for *in vitro* inhibition of <sup>3</sup>H-cytisine binding and <sup>3</sup>H- $\alpha$ -bungarotoxin binding and as described below.

20

***In vitro* inhibition of <sup>3</sup>H-cytisine binding**

Molecular biology studies have elucidated that there are at least ten nicotinic receptor genes in the brain. The predominant subtype with high affinity for nicotine is comprised of  $\alpha_4$  and  $\beta_2$  subunits. nAChRs of the latter type can selectively

25 be labelled by the nicotine agonist <sup>3</sup>H-cytisine.

Preparations are performed at 0-4°C.

Cerebral cortices from male Wistar rats (150-250 g) are homogenized for 20 sec in 15 ml Tris, HCl (50 mM, pH 7.4) containing 120 mM NaCl, 5 mM KCl, 1 mM MgCl<sub>2</sub> and 2.5 mM CaCl<sub>2</sub> using an Ultra-Turrax homogenizer. The homogenate is centrifuged at 27,000 x g for 10 min. The supernatant is discarded and the pellet is resuspended in fresh buffer and centrifuged a second time. The final pellet is resuspended in fresh buffer (35 ml per g of original tissue) and used for binding assays.

Aliquots of 500 µl homogenate are added to 25 µl of test solution and 25 µl of <sup>3</sup>H-cytisine (1 nM, final concentration), mixed and incubated for 90 min at 2°C. Non-specific binding is determined using (-)-nicotine (100 µM, final concentration). After incubation the samples are added 5 ml of ice-cold buffer and poured directly onto Whatman GF/C glass fibre filters under suction and immediately washed with 2 x 5 ml ice-cold buffer. The amount of radioactivity on the filters is determined by conventional liquid scintillation counting. Specific binding is total binding minus non-specific binding.

The test value is given as an IC<sub>50</sub> (the concentration (µM) of the test substance which inhibits the specific binding of <sup>3</sup>H-cytisine by 50%).

The IC<sub>50</sub> value is determined from the inhibition curve. If a full curve is not available a 25-75% inhibition of specific binding must be obtained, before calculation of an IC<sub>50</sub>.

$$IC_{50} = (\text{applied test substance concentration, } \mu\text{M}) \times \frac{1}{\left(\frac{C_0}{C_x} - 1\right)}$$

where C<sub>0</sub> is specific binding in control assays and C<sub>x</sub> is the specific binding in the test assay (the calculations assume normal mass-action kinetics).

The results are presented in Table 2 below.

### ***In vitro* inhibition of <sup>3</sup>H-α-bungarotoxin binding**

α-Bungarotoxin is a peptide isolated from the venom of the Elapidae snake *Bungarus multicinctus* [Mebs et al.; Biochem. Biophys. Res. Commun. 1971 44 (3) 711] and has high affinity for neuronal and neuromuscular nicotinic receptors, where it acts as a potent antagonist. <sup>3</sup>H-α-Bungarotoxin binds to a single site in rat brain with an unique distribution pattern in rat brain [Clarke et al.; J. Neurosci. 1985 5 1307-1315].

<sup>3</sup>H-α-Bungarotoxin labels nAChR formed by the α<sub>7</sub> subunit isoform found in brain and the α<sub>1</sub> isoform in the neuromuscular junction [Changeaux; Fidia Res. Found. Neurosci. Found. Lect. 1990 4 21-168]. Functionally, the α<sub>7</sub> homo-oligomer expressed

in oocytes has a calcium permeability greater than neuromuscular receptors and, in some instances greater than NMDA channels [*Seguela et al.*; *J. Neurosci.* 1993 13 596-604].

Preparations are performed at 0-4°C.

5 Cerebral cortices from male Wistar rats (150-250 g) are homogenized for 10 sec in 15 ml 20 mM Hepes buffer containing 118 mM NaCl, 4.8 mM KCl, 1.2 mM MgSO<sub>4</sub> and 2.5 mM CaCl<sub>2</sub> (pH 7.5) using an Ultra-Turrax homogenizer. The tissue suspension is centrifuged at 27,000 x g for 10 min. The supernatant is discarded and the pellet is washed twice by centrifugation at 27,000 x g for 10 min in 20 ml fresh  
10 buffer, and the final pellet is resuspended in fresh buffer containing 0.01% BSA (35 ml per g of original tissue) and used for binding assays.

Aliquots of 500 µl homogenate are added to 25 µl of test solution and 25 µl of <sup>3</sup>H-α-bungarotoxin (2 nM, final concentration), mixed and incubated for 2 h at 37°C. Non-specific binding is determined using (-)-nicotine (1 mM, final concentration). After  
15 incubation the samples are added 5 ml of ice-cold Hepes buffer containing 0.05% PEI and poured directly onto Whatman GF/C glass fibre filters (presoaked in 0.1% PEI for at least 6 h) under suction and immediately washed with 2 x 5 ml ice-cold buffer. The amount of radioactivity on the filters is determined by conventional liquid scintillation counting. Specific binding is total binding minus non-specific binding.

20 The test value is given as an IC<sub>50</sub> (the concentration (µM) of the test substance which inhibits the specific binding of <sup>3</sup>H-α-bungarotoxin by 50%).

The IC<sub>50</sub> value is determined from the inhibition curve. If a full curve is not available a 25-75% inhibition of specific binding must be obtained, before calculation of an IC<sub>50</sub>.

where C<sub>0</sub> is specific binding in control assays and C<sub>x</sub> is the specific binding in the test assay (the calculations assume normal mass-action kinetics).

The results are presented in Table 2 below.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 24  
because they relate to subject matter not required to be searched by this Authority, namely:  
**see next sheet**
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
